

VOICE-FIRST DESKTOP AI

MAYA

You talk. Your computer listens, thinks, and does the work.

- 234 tools · unlimited actions
- 24 categories
- Parallel agents
- Bring your own model
- Runs on your machine

WHAT MAYA IS

An assistant that doesn't just answer. It **operates the machine.**

Most AI assistants stop at conversation — they tell you which button to press. Maya presses it. She lives on your Windows desktop as a translucent overlay, listens continuously, and reaches into real applications: your browser, WhatsApp, Excel, VS Code, YouTube Studio, the file system, the volume mixer, even your Android phone. And when a job is too big for one command, she hands it to an agent — or several at once — that keep working while you carry on talking. **Speech goes in, work comes out.**

No typing loop

Speech isn't transcribed then re-read. One model hears the audio and answers in audio — so Maya catches tone, hesitation and interruption the way a person does.

Interrupt her

Talk over Maya mid-sentence and she stops instantly. Echo suppression means she never mistakes her own voice for yours.

She remembers

Facts about you, your projects, your last song, your ongoing work — carried across sessions, stored locally in plain files you can read.

SCALE

Everything a voice can reach

Maya ships with 234 individual voice-callable tools, grouped into 24 categories you can switch on or off. Nothing is a demo stub — every one of them is wired to a real Windows action.

234 BUILT-IN TOOLS	24 CATEGORIES	7 AUTONOMOUS AGENTS	∞ SKILLS YOU ADD
--	-------------------------------------	---	--

And 234 undersells it. That figure counts functions, not possibilities. One tool runs *any* command Windows accepts. Another presses *any* shortcut in *any* app. The agents take open-ended missions with no fixed script — and skills, plugins and macros let you add more. The real ceiling isn't a number we can print.

Tools per category

Core is always on. Every other category is a toggle in the HUD — enable only what you use.

New in 6.0: **Hermes agent** with Claude / ChatGPT subscription sign-in, parallel sub-agents, 10 more hands-free tools, a switchable coding engine, and one-click in-app updates.

RUN THE MACHINE

Hands off the keyboard

Maya drives Windows the way you would — opening apps, moving files, typing, pressing keys, running terminal commands. She can also see the screen and read it back to you.

PC control

25 tools

Open and close apps, minimize windows, show desktop, scroll, press any hotkey, type text, run PowerShell commands, sleep or restart the PC, clean temp files, control brightness and volume.

- "Open Photoshop and maximize it."
- "Run npm install in this folder."
- "Brightness 40, volume 20."

Files & folders

included

Search the disk, open a file by fuzzy name, list a folder, batch-rename hundreds of files, zip and unzip archives, sort a messy folder by extension, delete safely, read file contents aloud.

- "Find last month's invoice PDF and open it."
- "Rename every photo in Downloads to trip-001."
- "Clean up my Desktop by file type."

Screen vision

core

Maya can look at your screen and tell you what's there — read an error dialog, summarize a page, identify the focused app, or take a screenshot straight into a folder.

- "What does this error say?"
- "Read this contract's key points."

Clipboard & spreadsheets

3 + editor

Read the clipboard aloud, browse clipboard history, clear it. Edit Excel sheets by voice — change cells, add rows, apply formulas, build a dashboard from raw data.

- "What did I copy three items ago?"
- "Turn this sales sheet into a dashboard."

Reminders & scheduling

core

One-off, timed, or recurring reminders — spoken out loud when they fire. Schedule an actual *action*, not just a nudge: Maya can run a tool for you at 7 a.m. tomorrow.

- "Every Monday at 9, remind me to invoice."
- "At 6 p.m., send Rohit the report."

System health

analytics

Ask what's eating your CPU, how much RAM is free, whether the GPU is throttling, or for a full system health readout — spoken in plain language, not a task-manager screenshot.

- "Why is my PC slow right now?"
- "How's my system health?"

COMMUNICATION

Messages, mail, and your phone

Maya reaches the people you need to reach — through WhatsApp Desktop, your inbox, and a paired Android phone that she can dial, read, and control from your PC. She reads that inbox for you, too.

WhatsApp

8

Message any contact by name, attach a file or a whole folder, list unread chats, read a conversation aloud, place a call, or screenshot your screen and send it.

- "Send Mom yesterday's photos."
- "Who messaged me? Read them."

Email

4

Hear your unread mail summarized, dictate and send a new email, reply to a thread in your own voice, and clear out the spam folder — without opening a mail client.

- "Any important email today?"
- "Reply: I'll review it tonight."

Expenses

2

Maya reads the bank, UPI, card and order-receipt mails already sitting in your inbox, pulls the real transactions out of them, and answers spending questions out loud — total, top merchants, category split, or an itemized list.

- "How much did I spend today?"
- "What did last month go on?"

Phone link — Maya reaches into your Android

QR pairing

Scan a QR code once and your phone joins the same Maya session. From your desktop you can now: **ask your phone a question** and hear the answer here; **place a live voice call** to your phone and speak through it; run a **duet call** where desktop Maya and phone Maya talk to each other; or **control the phone directly** — open an app, read a notification, toggle a setting.

- "Ask my phone if I got an OTP."
- "Call my phone — I left it upstairs."
- "Open Instagram on my phone."

One session, two devices. The phone isn't a second assistant — it's the same Maya, same memory, same personality, borrowing another body. Nothing routes through a third-party cloud relay you don't control.

RESEARCH · DOCUMENTS · STUDY

She reads, writes, and files it for you

Point Maya at the open web or at your own document library. She'll browse autonomously, pull the facts, and hand back a finished Word doc, PDF, spreadsheet, or a spoken summary.

Web & browser agent

core

Quick web search, image search, or full page fetch. For anything harder, the **browser agent** takes the wheel — a real Chrome window Maya navigates herself, clicking through multi-step tasks while you watch. Logins persist.

- "Book me the cheapest flight to Delhi next Friday."
- "Compare these three laptops and tell me which wins."

Documents

11 tools

Create Word docs, PDFs, spreadsheets and résumés from a spoken brief. Index a folder of your own files, then ask questions across all of them. Turn an Excel export into a dashboard. A **document agent** handles long multi-file jobs.

- "Make me a two-page résumé from my LinkedIn facts."
- "Search my indexed papers for anything on CVD."

Research agent

deep dive

Give Maya a topic and walk away. She plans the research, visits sources, cross-checks them, and comes back with a structured report — cited, organized, and readable.

- "Research the EV battery supply chain. Write it up."

Whiteboard & study

6 tools

Maya opens a full-screen whiteboard and *draws while she explains* — diagrams, equations, flowcharts. Save or export the board when the lesson's done. Built for learning, not just note-taking.

- "Explain how a transformer works. Draw it."
- "Save the whiteboard as a PNG."

FOR PEOPLE WHO PUBLISH

A producer who never sleeps

Maya was built by a creator, for creators. She records the screen, commentates live, uploads the video, then reads you the analytics the next morning.

YouTube control

9

Search and play, skip, pause, download the current song or any track by name, and **upload a finished video** with title, description and tags — all by voice.

Channel analytics

8

Subscriber and view counts, recent uploads, growth against your last snapshot, and **audience sentiment** mined from a video's comments.

Screen recording

4

Start, pause, resume and stop a screen recording on command. Check status mid-take without breaking your flow.

Live commentary

2 tools

Turn commentary mode on and Maya watches your screen, reacting out loud as you play, code, or demo — a co-host who actually knows what's happening on screen. Perfect for streams and let's-plays where dead air kills retention.

● "Start commentary — roast my gameplay."

Music

8 tools

Play, pause, skip across any media app. Ask what's playing. Save favourites and taste preferences so "play something for focus" actually lands. Maya keeps a running list of what you listened to this session.

● "What's this song? Add it to my favourites."

Camera & faces

4

Look through the webcam, describe what she sees, capture a photo, and recognise people she's been introduced to.

Finance

3

Live stock quotes, ticker search, and price history read aloud while you keep working.

Weather

2

Current conditions and a forecast for wherever you actually are — no city typing needed.

BUILD SOFTWARE BY TALKING

Describe the app. Watch it get written.

Maya's coding agent scaffolds and edits real projects on disk. Say what you want; she opens VS Code, works in the integrated terminal so you can *see every step*, and tells you when it's done — or when the build broke and she's fixing it. Underneath, pick your engine: **Claude Code** (default — uses your existing subscription) or **HunterCode**. One switch in Settings.

01 Two modes

Quiet mode runs headless in the background. Visible mode opens the VS Code terminal and works in front of you, then writes a summary Maya reads back aloud.

02 It notices when it breaks

A terminal watcher reads build and runtime errors as they scroll past. Maya interrupts your session to say the build failed — and usually to say she already fixed it.

03 It gets better

Every task deposits a "lesson learned" that's recalled on the next run. Mistakes are made once.

04 Quick code

For a one-file script or a snippet, skip the whole agent — Maya just writes it.

"Maya, build me a Flask API with JWT auth, SQLite, and a Docker file. Put it in a new project."

Maya creates the project folder, picks the stack, writes every file, installs dependencies, runs it, hits the endpoint to confirm it responds, and tells you the port — while you make coffee.

Coding engine	Claude Code · or HunterCode
Projects live in	~/MayaProjects
Editor	VS Code (Prompt Runner)
Long jobs	Run in background
On completion	Maya announces it mid-chat

Bring your own model — universal API support

Maya is not locked to one AI vendor. Everything on the text side — the coding agent, quick code, document agents and research — can point at **any OpenAI-compatible endpoint**. Paste a base URL, a model id and a key into Settings and Maya switches over. Run a frontier model, a cheap one, or a fully offline local model on your own hardware.

- OpenAI
- OpenRouter
- Groq
- DeepSeek
- Ollama
- LM Studio
- ...any compatible API

DELEGATION · NEW IN 6.0

She doesn't do the big jobs herself. She **sends someone**.

A voice assistant that blocks for twenty minutes isn't an assistant. Give Maya something heavy and she spawns a background agent, keeps talking to you, and interrupts herself later to report back. Ask for five things at once and she runs **five agents in parallel**.

Sub-agents — one job, or many at once

core

Hand over one big multi-step job and a sub-agent plans it, then executes: terminal commands, folders, files, Word/Excel/PDF output, web research — and **every other tool in Maya's catalog**. Ask for several unrelated jobs and each gets its own agent, all running side by side. Ask "kaam kahan tak pahuncha?" any time and she'll tell you what each one is doing right now.

- "Take these five topics and write me a report on each."
- "How far along is that job?"

Hermes agent

Nous Research

Maya can also call in an outsider. **Hermes**, the open autonomous agent from Nous Research, runs in its own sandboxed runtime and takes truly open-ended missions — planning, running real shell commands, writing and editing files, and **learning skills from its own experience** as it goes. Power it with your own **Claude Pro/Max or ChatGPT Plus subscription** — sign in once, no separate API key. It runs in the background; Maya speaks up when it lands.

- "Hermes se bolo: ye dataset process karke report banaye."
- "Give Hermes the repo and let it add the feature."

Who gets the job

Maya picks the right agent for the task — you never name one unless you want to.

Browser agent

Multi-step missions in a real Chrome window you can watch. Your logins persist.

Desktop agent

The same, for native Windows apps — observe, act, look again, until it's done.

Research agent

Plans a deep dive, visits and cross-checks sources, hands back a real Word doc or PDF.

Document agent

Long multi-file document jobs — draft, format, export, file it away.

Coding agent

Ships real software: Claude Code or HunterCode, live in the VS Code terminal.

Skill author

Writes, tests and installs a brand-new Python skill when nothing else fits.

Nothing blocks the conversation. Every agent runs in the background — Maya never goes silent waiting on one. She keeps chatting, and cuts in the moment a job finishes, fails, or needs a decision from you.

HANDS-FREE COMPUTING

For anyone who can't use a mouse

This is the category Maya is proudest of — and the one that grew most in 6.0, from fifteen tools to **twenty-five**. Complete voice control over the web and the Windows desktop: click any button, fill any form, switch any tab, read any screen — with no mouse and no keyboard, ever.

On the web

16 tools

Maya attaches to a persistent Chrome window — the same one your logins live in. She reads the page structure, then clicks, types, selects dropdowns, presses keys, scrolls and fills entire forms on command. New in 6.0: full **tab management** — list your open tabs, switch to one by name, close it. Deterministic and instant: no guessing, no screenshots.

- "Click the blue Sign In button."
- "Fill the form: name Hunter, email mine, message hello."
- "What tabs do I have open? Switch to Gmail."

On the desktop

9 tools

Maya reads any Windows app's controls and speaks them back as a **numbered list** — "one, Save. two, Cancel." You say the number. If an app hides its controls, she falls back to on-screen text recognition and clicks anyway. Raw pointer control — move, click, drag — is there when nothing else will do. Desktop icons included, even with the HUD in front.

- "Read the screen."
- "Click number four."
- "Drag that file onto the Recycle Bin."

Single action, or whole mission. Say "click Submit" and Maya does exactly that, once. Say "go book my train ticket" and an agent from the previous page takes over — observing, deciding, and acting step after step until the task is finished or it needs you.

Even her own window

The HUD obeys your voice too — hide it, minimize it, or send it to any corner of the screen when it's in the way. No dragging required.

- "Maya, move yourself to the bottom-left."

Sleep & wake, hands-free

Say "so jao" and Maya sleeps — the live session actually closes, so she costs nothing while idle. "Hey Maya" wakes her again, recognised offline on your machine. Your phone can wake her from across the house.

- "Hey Maya — wake up."

SKILLS · PLUGINS · MACROS

Maya can write her own abilities

Most assistants ship with a fixed list of things they can do. Maya extends herself — writing, testing and installing new Python skills at runtime, on your instruction.

01 Self-authored skills — 10 tools

Ask for a capability she doesn't have. Maya writes the code, sandbox-tests it, versions it, and installs it. If a skill misbehaves later, she improves it or rolls it back to the last version that worked.

"Maya, learn to convert HEIC photos to JPEG."

02 A marketplace of skills

Browse a curated, open-source catalog and install with a sentence. Or pull a skill from a GitHub repo, a local folder, or a zip. Two flavours: Python skills that run code, and prompt skills that teach Maya a new way of thinking.

"Show me the skill marketplace. Install the PDF one."

03 Plugins for developers

Drop a Python file with a `MAYA_PLUGIN` dict into the HUD's plugin tab — by file, by GitHub URL, or from the plugin marketplace — and your own functions become voice commands. No fork, no rebuild.

04 Macros — teach by doing — 13 tools

Hit record, do the task once with your own hands, and say stop. Maya keeps the steps as a named macro she can replay, edit step-by-step, duplicate, schedule, export, or share.

"Record a macro. ...Stop. Call it 'morning setup' and run it every day at 9."

Memory that persists

Sentence-level facts about your life, keyed personal details, a session transcript and behaviour analytics — all in local files. She recalls them unprompted, and forgets on command.

Voice guardian

8

Maya learns your voiceprint. Guests get a restricted toolset — no file deletion, no terminal, no personal memory. Arm her and she'll tell you who spoke while you were away.

Three personas

Say a name and Maya becomes someone else — voice and personality both. **Maya**, warm and familiar. **Friday**, crisp and professional. **Venom**, a deep-voiced symbiote who is rude to everyone except you.

IN PRACTICE

Twelve hours, no keyboard

What 234 tools actually feels like, from the moment you sit down.

- **08:40**
"Morning. Daily briefing."
Weather, your calendar, unread mail, overnight channel growth, and what's still pending from yesterday.
- **09:05**
"Run my morning setup macro."
VS Code, Chrome tabs, Spotify, and the project folder — all open before your coffee lands.
- **10:20**
"Build the auth service. Watch it in the terminal."
The coding agent takes the brief. Twenty minutes later Maya says the tests pass.
- **12:00**
"What did the build error say?"
She'd already read it off the screen, patched the import, and re-run it.
- **13:15**
"Send Priya the spec, and attach the PDF."
WhatsApp opens, contact matched, file attached, message sent.
- **15:00**
"Research all three competitors. One report each."
Three sub-agents run in parallel. Maya keeps talking to you, then reads out each report as it lands.
- **16:30**
"Start recording. Start commentary."
Screen capture rolls; Maya co-hosts, reacting to what's on screen in real time.
- **18:00**
"Stop. Upload it — title it Episode 12."
Recording saved, video uploaded to YouTube, description and tags written for you.
- **20:45**
"Ask my phone if the delivery arrived."
The paired Android answers through your desktop speakers.
- **23:10**
"Remind me Monday at nine to invoice. Then sleep the PC."
Recurring reminder set. Screen goes dark. Maya says goodnight.

Not one of those lines required a mouse, a menu, or knowing which app does what. **That's the entire point.**

SPECIFICATIONS

Runs on the PC you already own.

One installer. One API key. No subscription to a middleman, no data warehouse holding your conversations — memory, documents and voiceprints stay in files on your disk.

Platform	Windows 10 / 11	Voice engine	Google Gemini Live API key
Version	Maya 6.0.8	Text / code models	Any OpenAI-compatible API
Interface	Voice + translucent HUD overlay	Coding engine	Claude Code or HunterCode
Wake word	"Hey Maya" (offline)	Subscription sign-in	Claude Pro/Max · ChatGPT Plus
Updates	One-click, in-app	Autonomous agents	Sub-agents, Hermes, browser, desktop
Voice tools	234 across 24 categories	Companion	Android app via QR pairing

SYSTEM REQUIREMENTS

MINIMUM		RECOMMENDED	
OS	Windows 10 64-bit (21H2+)	OS	Windows 11 64-bit
CPU	4-core, 2.5 GHz	CPU	6-core, 3.5 GHz+
RAM	8 GB	RAM	16 GB
Disk	6 GB free	Disk	12 GB free on SSD
Audio	Any mic + speakers	Audio	Headset mic
Network	Stable broadband	GPU	Dedicated GPU (faster voice ID)

Every assistant can talk. The question worth asking is what happens after it finishes talking. With Maya, something on your computer has changed.
